1 INTRODUCTION

Close collaboration between the Metrology Research Institute of Aalto University and MIKES Metrology of VTT Technical Research Centre of Finland Ltd has continued after the merge of MIKES to VTT in the beginning of 2015, leading to many research highlights in the period 2015–2017 of this triennial report. An article on “Advantages of white LED lamps and new detector technology in photometry” by Pulli *et al* was published in *Light: Science and Application* (4, e332, 2015), a journal with high impact factor of 14.6. Another highlight of 2016 was the start and excellent results of the European PhotoLED project (Future photometry based on solid state lighting products), coordinated by Tuomas Pölkonen at VTT and Aalto University. Finally, several oral contributions in top-class international conferences were achieved by researchers of the Institute: One invited talk and four oral contributions in the NEWRAD Conference (Tokyo 2017) and five oral contributions in the CIE Conference (Korea 2017).

The research group moved to new laboratory premises at Maariintie 8 in the beginning of 2017. The move was a major effort for all the personnel, because of the dedicated laboratory instruments that had to be re-installed and put into operation at the new place. The new premises offer better conditions for high-accuracy measurements than the old laboratories at Otakaari 5. It was an excellent achievement that all equipment was again operational by the end of 2017.

The Metrology Research Institute provides teaching within Aalto University and it operates under the Finnish name MIKES-Aalto Mittaustekniikka as the Finnish national standards laboratory for optical quantities. Seven doctoral degrees and seven M.Sc. degrees were achieved in 2015–2017. Four of the doctoral degrees were achieved in 2017, which is the highest yearly number of the Institute ever. The number of calibration certificates issued in 2015–2017 is 141, which leads to about the same yearly numbers as for the period 2013–2014. The 1000th calibration certificate issued by the Institute was celebrated at the end of year 2017.

4 NATIONAL STANDARDS LABORATORY

Metrology Research Institute is the Finnish national standards laboratory for the measurements of optical quantities, as appointed by the Centre for Metrology and Accreditation (now VTT MIKES) in April 1996.

The institute gives official calibration certificates on various optical quantities in the fields of Photometry, Radiometry, and Spectrophotometry. During 2015 – 2017, 141 calibration certificates were issued. The calibration services are mainly used by the Finnish industry and various research organizations. There are two accredited calibration laboratories in the field of optical quantities.

The Institute offers also other measurement services and consultation in the field of measurement technology. Various memberships in international organizations ensure that the laboratory can also influence e.g. international standardization so that it takes into account the national needs.

The Metrology Research Institute performs its calibration measurements under a quality system approved by VTT MIKES. The quality system is based on ISO/IEC 17025.

Further information on the offered calibration services can be obtained from the web-pages of the laboratory (<http://metrology.aalto.fi/>). Especially the following sub-pages might be useful:

5 RESEARCH PROJECTS

Light is everywhere around us in the form of sunlight, artificial lighting and signaling. Most electrical equipment use either visible or infrared radiation for signaling, displays, sensing, data read-out, or digital communication. Color is one of the most significant properties in consumer products.

Metrology research of Optical Radiation Measurements is divided into three branches: Radiometry dealing with characteristics of light sources and detectors, Photometry measuring light as people see it, and Spectrophotometry investigating optical components as well as of optical properties of materials. Some of the facilities developed in the laboratory are at the world-leading level when comparing accuracy, compactness, and operating costs. The research activities of the group involve electronics, modern optics and optical radiation measurements.

Metrology Research Institute is a joint laboratory of Aalto University and VTT MIKES, and it is involved in many national and international projects. Most of the research in the laboratory is currently carried out within EURAMET EMRP and EMPIR programmes. Metrology Research Institute is the national standards laboratory for optical quantities in Finland maintaining national standards of optical quantities and carrying out calibrations at the highest level.

6 INTERNATIONAL CO-OPERATION

6.1 International Comparison Measurements

Since 2005, the Metrology Research Institute participates in key comparisons under the name MIKES.

Key comparison EURAMET.PR-K6.2015, spectral transmittance 380–1000 nm, pilot CNAM

This comparison is on average spectral regular transmittance of filters. Five neutral grey glass filter plates, 50 mm × 50 mm, with nominal transmittance, at the wavelength of 546 nm, of 0.92, 0.50, 0.10, 0.01 and 0.001, will be measured. Pilot has measured the samples twice and MIKES once. One measurement at MIKES is thus still needed.

XDReflect BRDF comparison 380–780 nm, pilot PTB

This comparison of spectral radiance factor was carried out within the European Metrology Research Program (EMRP) project JRPIND52, XDReflect. The final report was published in 2017 [C. Strothkämper, A. Ferrero, A. Koo, P. Jaanson, G. Ged, G. Obein, S. Källberg, J. Audenaert, F. Leloup, F. Martinez Verdu, E. Perales, A. Schirmacher, J. and Campos, “Multilateral Spectral Radiance Factor Scale Comparison,” *Applied Optics* **56**, 1996–2006 (2017)]. The results of MIKES are in good agreement with the white tile used, but with gray and dark grey samples, the results deviate slightly above 750 nm.

Key comparison EURAMET.PR-K4, luminous flux, pilot PTB

Measurements of MIKES-Aalto were completed in 2009. Final report was published in 2015 [Matthias Lindemann, Robert Maass, and Georg Sauter, “Final report on regional comparison EURAMET.PR-K4: luminous flux,” *Metrologia* **52**, 02001 (2015). <https://doi.org/10.1088/0026-1394/52/1A/02001>]. The results of MIKES were in good agreement with the key comparison reference value. The unilateral degree of equivalence was 0.0003 with an uncertainty of 0.0076. The uncertainty specified by MIKES was 0.0028 ($k = 1$).

6.6 Thematic Network for Ultraviolet Radiation Measurements (UVNet)

The Thematic Network for Ultraviolet Measurements (UVNet) was very active during this period. The UVNet including its mailing list was used to disseminate progress and results of the EU-funded EMRP project ATMOZ, Traceability for atmospheric total column ozone. This project was coordinated by Julian Gröbner and Luca Egli of the PMOD/WRC in Davos, Switzerland.

UVnet produced two newsletters, *UVNews 11* in March 2016 and *UVNews 12* in March 2017. These newsletters included altogether 21 articles on 104 pages presenting the project results and other UV and ozone related activities.
